The invention relates to an isolated Her-2/Neu polypeptide composition effective for eliciting an immune response. The invention is useful for eliciting an immune response. The invention is useful for calciting an immune response. The invention is useful for the leavest the patient is human leakcoyte antigen (HLA)-B44 positive or is affected with breast cancer. The composition is useful for the therapy and diagnosis of cancer. The compositions for the diagnosis, prevention and treatment of and other compositions for the diagnosis, prevention and treatment of human malignancies, for stimulating and/or expanding T cells specific for her-2/Neu polypeptide and for inhibiting the development of cancer in a patient. The invention is useful for stimulating a T cell response in a companient, as probe or primer for nucleic acid hybridisation, to selectively form duplex molecules with complementary stretches of the entire Her-2/Neu gene or gene fragments of interest, to isolate a full companient fragment so direct expression of a polypeptide in appropriate host cells. The composition is useful in propriate in appropriate post cells. The composition is useful in preferably for the immunotherapy of breast cancer and other Her-2/Neuron second sequence is human connection is useful in gene therapy. The present sequence is human connection entiton is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1066 TTCTTCTGTCCAGACCCTGCCCGGGGGCTGGGGGCATGGTCCACCACAGGCACCGCAGC 1125

                                                                                                                                                                                                                                                                                                                                                                                                                                  frective for eliciting an immune response. The invention is useful for eliciting an immune response in a patient, where the patient is human leukoyte antigen (HLA)-84 positive or is affected with breast cancer. The composition is useful for the therapy and diagnosis of cancer. The composition is useful for the therapy and diagnosis of cancer. The composition is useful for the diagnosis, prevention and treatment of and other compositions for the diagnosis, prevention and treatment of human malignancies, for stimulating and/or expanding T cells specific for Her-2/Neu polypeptide and for inhibiting the development of cancer in a human patient, as probe or primer for nucleic acid hybridisation, to selectively form duplex molecules with complementary stretches of the numan patient a suitable library, and to direct expression of a polypeptide in appropriate host cells. The composition is useful in polypeptide in appropriate host cells. The composition is useful in greeferably for the immunotherapy of breast cancer and other Her-2/Neu-associated malignancies. The invention is useful in gene therapy. The present sequence is human cDNA for the clone HICD_CT_His_coding_region.

The invention relates to an isolated Her-2/Neu polypeptide composition effective for eliciting an immune response. The invention is useful for eliciting an immune response. The invention is useful for eliciting an immune response. The invention is useful for eliciting an immune response in a patient, where the patient is human leavest entired. The composition is useful for the therapy and diagnosis of cancer. The composition for the diagnosis, prevention and treatment of of numan malignancies, for stimulating and/or expanding T cells specific for Her-2/Neu polypeptide and for inhibiting the development of cancer in a patient. The juvention is useful for stimulating a real response in a comman patient, as probe or primer for nucleic acid hybridisation, to selectively form duplex molecules with complementary stretches of the entire Her-2/Neu gene or gene fragments of interest, to isolate a full clength gene from a suitable library, and to direct expression of a polypeptide in appropriate host cells. The composition is useful in complement of cancer, preferably for the immunotherapy of breast cancer and other Her-2/Neu-comman contract in gene therapy. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human HER-2/neu oncogene cDNA (AAT40739) codes for HER-2/enu (p185 or c-erbE2) protein (AAM01111). The oncogene is overexpressed in various cancers, including breast, ovarian, colon, lung and prostate, and appears to induce malignancies through quantitative mechanisms that result from increased or deregulated expression of an essentially normal gene product. Nucleotides 2026-3765 of the cDNA, sequence code for the intracellular domain (Ly8676-Vall255) of the HER-2/neu protein, which is useful for immunisation against malignancy. Nucleic acids can be used to direct expression of the intracellular domain in transformed host cells, or are used, alone or in a viral vector, for genetic immunisation of an animal.

```
This sequence encodes the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for eliciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a mailgnancy in which the HER-2/neu oncogene is associated and in the treatment of an existing tumour, or to prevent tumour occurrence or reoccurrence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20

                                                                                                                                                                                                                                               The invention provides an isolated antigen-presenting cell, which expresses at least an immunogenic portion of a polypeptide that produces an immune response to HER-2/new protein. The antigen-presenting cells are useful as vaccines for eliciting or enhancing an immune response to HER-2/new protein, particularly in treating or preventing malignancies in which the HER-2/new oncogene is associated. Specifically, these are useful for treating or preventing cancer, e.g. breast cancer, ovarian, colon, lung or prostate cancers. The present sequence represents a DNA colon, lung or prostate cancers. The present sequence represents a DNA colon, lung or prostate cancers and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3087

The invention is useful for eliciting an immune response in a patient, where the patient is human leukocyte antigen (HLA)-B44 positive or is affected with breast cancer. The composition is useful for the therapy and diagnosis of cancer, preferably breast cancer, in pharmaceutical compositions, e.g., vaccine and other compositions for the diagnosis, prevention and treatment of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3567
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             140
human malignancies, for stimulating and/or expanding T cells specific for patient. The invention is useful for stimulating a T cell response in a patient. The invention is useful for stimulating a T cell response in a human patient, as probe or primer for nucleic acid hybridisation, to selectively form duplex molecules with complementary stretches of the entire Her-2/Neu gene or gene fragments of interest, to isolate a full length gene from a suitable library, and to direct expression of a polypeptide in appropriate host cells. The composition is useful in preferably for the immunotherapy of breast cancer and other Her-2/Neu-associated malignancies. The invention is useful in gene therapy The present sequence is human Her-2/Neu protein DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

The present sequence is that of human Her-2/neu oncogene cDNA.

The cDNA encodes Her-2/neu (p185), an oncogenic self protein and target for anti-cancer vaccines. The Her-2/neu gene is amplified and p185 is overexpressed in a variety of cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins.

Its overexpression exinase family of receptor-like glycoproteins.

Its overexpression proteins with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu fusion proteins or nucleic acid molecules. In preferred fusion proteins or nucleic acid molecules. In protein is fused to a Her-2/neu intracellular domain of a Her-2/neu phosphorylation of Her-2/neu intracellular domain or phosphorylation domain (or its Dellapp fragment). An immune response to Her-2/neu protein is elicited or enhanced by transfering the fusion protein is elicited or enhanced by transfering the fusion protein is elicited or enhanced cells concoding the fusion protein, and delivering the transfected cells concoding the fusion protein, and delivering the transfected cells concoding the fusion protein, and delivering the transfected cells concoding the fusion protein, and delivering the development of a cancer, especially breast, ovarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu fusion protein can be used to remove tumour cells from a sample in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method for inhibiting development of mematological malignancy in a patient by administering a polypeptide comprising an immunogenic portion of Her-Z/neu or a polypurclectide encoding the polypeptide. Antigen presenting cells that express the protein can also be administered. The sequences are used for inhibiting development of haematological malignancy such as acute myelogenous leukaemia (AML), chronic myelogenous leukaemia (CML), chronic lymphocytic leukaemia (CLL), MDS, myelomas, Hodgkin's lymphoma and non-Hodgkin's lymphoma. This sequence represents DNA encoding human Her-Z/neu

The erbel 2 polynucleotide is used to construct probes for detecting disorders of cell transformation such as cancer. Antibodies to the protein may be used to detect SPLICE erbel-2 in a sample. Agents (e.g. antispanse oligonucleotides) which inhibit the expression of SPLICE erbs-2 are useful for reducing tumor cell proliferation and treating cancer. Substances which stimulate SPLICE erbs-2 are useful for reducing tumor cell proliferation and treating conditions involving damaged cells including conditions in which degeneration of tissue occurs, such as arthropathy, bone resorption, inflammatory diseases, degenerative disorders of the central nervous system and wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid encoding an erbB 2 receptor protein designated SPLICE erbB-2, inhibitors of the protein are useful for treatment of cancer

This invention describes a novel method for generating a cellular immune response in a patient to a target protein or its fragment. The method involves introducing a vector containing a nucleotide sequence encoding a chimeric immunogen comprising a protein processing signal and the target protein or its fragment. The immunogen is produced by the cells and processed so that the target protein or its fragment is presented to the patients immune system and a cellular immune response is initiated. The method and vectors can be used as a form of vaccination and could be used to generate a cellular immune response in patients to, e.g. cancerous tumours. The cellular immune response is the predominant immune response in the patient. This sequence represents a DNA fragment which encodes the human tumour antigen ErbB-2 described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3321

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3681
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3801
                                                called c-neu and ErbB2, encodes a transmembrane receptor, with tyrosine kinase activity. HER-2 is related to the epidermal growth factor receptor (EGER or HER-1). Aberrant HER-2 expression is present in a wide number of cancers, especially breast, ovarian and gastric cancers. This sequence is used in the invention to design 12-25 nucleotide oligonucleotides that decrease the expression of human HER-2. The modulating the expression of human epidermal growth factor receptor. The oligonucleotides are used to treat diseases or conditions associated with HER-2, particularly hyperproliferative diseases such as cancer.

The invention relates to a gene expression profile comprising one or more genes (ABZ34889-ABZ35692) and generated from a cell type. The cell type is a coronary artery endothelium, umbilical artery or vein endothelium, cartic endothelium, dermal microvascular endothelium, pulmonary artery cepithelium, prostate prochable pathelium, nammary epithelium, prostate cepithelium, renal epithelium, renal prothelium, renal epithelium, renal prothelium, renal epithelium, renal prothelium, renal cortical epithelium, renal prothelium, smooth muscle, mescala dermal fibroblast, pulmonary artery smooth muscle, dermal fibroblast, pulmonary artery smooth muscle, cornic smooth muscle, mesangial cells, coronary artery smooth muscle, actric smooth muscle, uterine smooth muscle, astrocytes, cortic smooth muscle, uterine smooth muscle, notetal smooth muscle, uterine smooth muscle, notetal stromal cells, coronary artery smooth muscle, cotecoblasts or prostate stromal cells, coronary artery smooth muscle, cotecoblasts or prostate stromal cells, coronary artery smooth muscle, cotecoblasts or prostate stromal cells, coronary artery smooth muscle, cotecoblasts or prostate stromal cells, respect or a sample, determining the level of RNA expression for a sample, determining the cote and distinguishing cell types. The gene or a protein corporation profile may also be used for creating miscrearrays. The corporation profile may also be used for creating miscrearrays. The confirming cell or tissue identifications and inidentifying promising confirming cell or tissue identifications and inidentifying promising confirming cell or antifungal agents.

                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense oligonucleotide which modulates the expression of Human Epidermal Growth Factor receptor, Her2, is useful for treating tumors inflammation or to prevent infection in humans -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to antisense compounds targetted to a nucleic acid molecule encoding Her2 (human Epidermal Growth Factor receptor 2) that specifically hybridises with and inhibits the expression of Her2. Antisense compounds of the invention are used for treating diseases or conditions associated with Her2 such as hyperproliferative disorders e.g. lung, breast, gastric, oesophageal, colon, bladder, salivary, neural or cardiac cancer. They are also useful prophylactically e.g. to prevent or delay infection, inflammation and tumour formation. The invention is also used in gene therapy. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SerSerThrArgSerGlyGlyGlyAspLeuThrLeuGlyLeuGluProSerGluGluGlu
